

In this hackathon, we develop a personal business assistant based on an agent which we developed on Digital Ocean with no code.

Once agent is developed, the agent URL is integrated in the Auth0 personal business assistant codebase. The agent is system prompted to answer financial performance.

Auth0 integration gives frontend and backed api security while Digital Ocean offers a no code agent development with API access.

LLM runs on Digital Ocean. Model **OpenAI GPT-oss-120b** was used.

Details

The screenshot displays the DigitalOcean Agents management interface. On the left is a dark sidebar with navigation options: PROJECTS, MANAGE (with a sub-menu including App Platform, Agent Platform, Droplets, GPU Droplets, Functions, Kubernetes, Volumes Block Storage, Databases, Spaces Object Storage, Container Registry, Backups & Snapshots, and Networking), and a search bar. The main content area has a top bar with a search input, a 'Create' button, and team information. Below this is a 'No results found' message. The central panel shows the 'ENDPOINT' details for a private agent, including its status, URL, and access keys. To the right, a 'AGENT DAILY TOKEN USAGE' table shows input and output tokens with their respective costs, and an 'Estimated monthly token usage' of \$0.00. At the bottom right, the 'RESOURCES' section lists the model as 'OpenAI GPT-oss-120b' and knowledge bases as 'None'.

Metric	Value	Cost
Input tokens	384 @ \$0.10/1M	\$0.00
Output tokens	3,745 @ \$0.70/1M	\$0.00

Resource	Value
Model	OpenAI GPT-oss-120b
Knowledge bases	None
